

## NEW AZETIDINE COMPOUNDS

Field of the Invention

5 The present invention relates to new compounds of formula I, to pharmaceutical compositions containing said compounds and to the use of said compounds in therapy. The present invention further relates to processes for the preparation of compounds of formula I and to new intermediates used in the preparation thereof.

Background of the invention

10 The neurokinins, also known as the tachykinins, comprise a class of peptide neurotransmitters which are found in the peripheral and central nervous systems. The three principal tachykinins are Substance P (SP), Neurokinin A (NKA) and Neurokinin B (NKB). At least three receptor types are known for the three principal tachykinins. Based upon their relative selectivities favouring the agonists SP, NKA and NKB, the receptors are classified as neurokinin 1 (NK<sub>1</sub>), neurokinin 2 (NK<sub>2</sub>) and neurokinin 3 (NK<sub>3</sub>) receptors, respectively.

20 There is a need for an orally active and blood brain barrier crossing dual NK<sub>1</sub>/NK<sub>2</sub> receptor antagonist for the treatment of e.g. respiratory, cardiovascular, neuro, pain, oncology, inflammatory and/or gastrointestinal disorders. In order to increase the therapeutic index of such therapy it is desirable to obtain such a compound possessing no or minimal toxicity as well as being selective to said NK receptors. Furthermore, it is considered necessary that said medicament has favourable pharmacokinetic and metabolic properties thus providing an improved therapeutic and safety profile such as lower liver enzyme inhibiting properties.

30 It is well known that severe problems such as toxicity may occur if plasma levels of one medication are altered by the co-administration of another drug. This phenomenon - which

is named drug-drug interactions – could happen if there is a change in the metabolism of one drug caused by the co-administration of another substance possessing liver enzyme inhibiting properties. CYP (cytochrome P450) 3A4 is the most important enzyme in the human liver as a majority of oxidised drugs have been biotransformed by this enzyme.

5 Accordingly, it is undesirable to employ a medication having a significant degree of such liver enzyme inhibiting properties. It has now been found that many NK receptor antagonists known in the art inhibit the CYP3A4 enzyme to a certain level and consequently there is a possible risk if high doses of those compounds are being used in therapy. Thus, there is a need for a novel dual NK<sub>1</sub>/NK<sub>2</sub> receptor antagonist with improved  
10 pharmacokinetic properties. The present invention provides compounds with CYP3A4 enzyme inhibiting properties at a low level, as comparatively high IC<sub>50</sub> values are obtained in a CYP3A4 inhibiting assay. Said method for determining CYP3A4 inhibition is described in Bapiro et al; Drug Metab. Dispos. 29, 30-35 (2001).

20 “4-Amino-2-(aryl)-butylbenzamides and Their Conformationally Constrained Analogues. Potent Antagonists of the Human Neurokinin-2 (NK<sub>2</sub>) Receptor”, *Roderick MacKenzie, A., et al, Bioorganic & Medicinal Chemistry Letters*, In Press, available online 15 May 2003, discloses the compound *N*-[2-(3,4-dichlorophenyl)-4-(3-morpholin-4-ylazetid-1-yl)butyl]-*N*-methylbenzamide which was found to possess functional NK<sub>2</sub> receptor  
25 antagonistic properties.

WO 96/05193, WO 97/27185 and EP 0962457 disclose azetidinyllactam derivatives with tachykinin antagonist activity.

EP 0790248 discloses azetidinyllazapiperidones and azetidinyllaxapiperidones, which are stated to be tachykinin antagonists.

WO 99/01451 and WO 97/25322 disclose azetidinyllpiperidine derivatives claimed to be tachykinin antagonists.

EP 0791592 discloses azetidinyllglutarimides with tachykinin antagonistic properties.

An object of the present invention was to provide novel tachykinin antagonists useful in therapy. A further object was to provide novel compounds having blood brain barrier penetrating properties, improved pharmacokinetic and metabolic properties and/or improved selectivity for the NK<sub>1</sub>/NK<sub>2</sub> receptors.

## Pharmacology

### *Transfection and culturing of cells used in FLIPR and Binding assays*

Chinese Hamster Ovary (CHO) K1 cells (obtained from ATCC) were stably transfected with the human NK<sub>2</sub> receptor (hNK<sub>2</sub>R cDNA in pRc/CMV, Invitrogen) or the human NK<sub>3</sub> receptor (hNK<sub>3</sub>R in pcDNA 3.1/Hygro (+)/IRES/CD8, Invitrogen vector modified at AstraZeneca EST-Bio UK, Alderley Park). The cells were transfected with the cationic lipid reagent LIPOFECTAMINE™ (Invitrogen) and selection was performed with Geneticin (G418, Invitrogen) at 1mg/ml for the hNK<sub>2</sub>R transfected cells and with Hygromycin (Invitrogen) at 500µg/ml for the hNK<sub>3</sub>R transfected cells. Single cell clones were collected by aid of Fluorescence Activated Cell Sorter (FACS), tested for functionality in a FLIPR assay (see below), expanded in culture and cryopreserved for future use. CHO cells stably transfected with human NK<sub>1</sub> receptors originates from AstraZeneca R&D, Wilmington USA. Human NK<sub>1</sub> receptor cDNA (obtained from RNA-PCR from lung tissue) was subcloned into pRcCMV (Invitrogen). Transfection was performed by Calcium Phosphate and selection with 1mg/ml G418.

The CHO cells stably transfected with hNK<sub>1</sub>R, hNK<sub>2</sub>R and hNK<sub>3</sub>R were cultured in a humidified incubator under 5% CO<sub>2</sub>, in Nut Mix F12 (HAM) with Glutamax I, 10% Foetal Bovine Serum (FBS), 1% Penicillin/Streptomycin (PEST) supplemented with 200µg/ml Geneticin for the hNK<sub>1</sub>R and hNK<sub>2</sub>R expressing cells and 500µg/ml Hygromycin for the hNK<sub>3</sub>R expressing cells. The cells were grown in T175 flasks and routinely passaged when 70-80% confluent for up to 20-25 passages.

***Assessing the Activity of Selected test Compounds to Inhibit Human NK<sub>1</sub>/NK<sub>2</sub>/NK<sub>3</sub>***

***Receptor Activation (FLIPR assay)***

The activity of a compound of the invention to inhibit NK<sub>1</sub>/NK<sub>2</sub>/NK<sub>3</sub> receptor activation measured as NK<sub>1</sub>/NK<sub>2</sub>/NK<sub>3</sub> receptor mediated increase in intracellular Ca<sup>2+</sup> was assessed by the following procedure:

CHO cells stably transfected with human NK<sub>1</sub>, NK<sub>2</sub> or NK<sub>3</sub> receptors were plated in black walled/clear bottomed 96-well plates (Costar 3904) at 3.5x10<sup>4</sup> cells per well and grown for approximately 24h in normal growth media in a 37°C CO<sub>2</sub>-incubator.

Before the FLIPR assay the cells of each 96-well plate were loaded with the Ca<sup>2+</sup> sensitive dye Fluo-3 (TEFLABS 0116) at 4µM in a loading media consisting of Nut Mix F12 (HAM) with Glutamax I, 22mM HEPES, 2.5mM Probenicid (Sigma P-8761) and 0.04%

Pluronic F-127 (Sigma P-2443) for 1 h kept dark in a 37°C CO<sub>2</sub>-incubator. The cells were then washed three times in assay buffer (Hanks balanced salt solution (HBSS) containing 20mM HEPES, 2.5mM Probenicid and 0.1% BSA) using a multi-channel pipette leaving them in 150µl at the end of the last wash. Serial dilutions of a test compound in assay buffer (final DMSO concentration kept below 1%) were automatically pipetted by FLIPR (Fluorometric Imaging Plate Reader) into each test well and the fluorescence intensity was recorded (excitation 488 nm and emission 530 nm) by the FLIPR CCD camera for a 2 min pre-incubation period. 50µl of the Substance P (NK<sub>1</sub> specific), NKA (NK<sub>2</sub> specific), or Pro-7-NKB (NK<sub>3</sub> specific) agonist solution (final concentration equivalent to an approximate EC<sub>60</sub> concentration) was then added by FLIPR into each well already containing 200µl assay buffer (containing the test compound or vehicle) and the

fluorescence was continuously monitored for another 2 min. The response was measured as the peak relative fluorescence after agonist addition and  $IC_{50}$ s were calculated from ten-point concentration-response curves for each compound. The  $IC_{50}$ s were then converted to  $pK_B$  values with the following formula:

$$K_B = IC_{50} / 1 + (EC_{60} \text{ conc. of agonist used in assay} / EC_{50} \text{ agonist})$$
$$pK_B = -\log K_B$$

***Determining the Dissociation Constant ( $K_i$ ) of compounds for Human  $NK_1/NK_2/NK_3$  Receptors (Binding Assay)***

10 Membranes were prepared from CHO cells stably transfected with human  $NK_1$ ,  $NK_2$  or  $NK_3$  receptors according to the following method.

Cells were detached with Accutase® solution, harvested in PBS containing 5% FBS by centrifugation, washed twice in PBS and resuspended to a concentration of  $1 \times 10^8$  cells/ml in Tris-HCl 50 mM, KCl 300 mM, EDTA- $N_2$  10 mM pH 7.4 (4°C). Cell suspensions were  
15 homogenized with an UltraTurrax 30 s 12.000 rpm. The homogenates were centrifuged at  $38.000 \times g$  (4°C) and the pellet resuspended in Tris-HCl 50 mM pH 7.4. The homogenization was repeated once and the homogenates were incubated on ice for 45 min. The homogenates were again centrifuged as described above and resuspended in Tris-HCl 50mM pH 7.4. This centrifugation step was repeated 3 times in total. After the last  
20 centrifugation step the pellet was resuspended in Tris-HCl 50mM and homogenized with Dual Potter, 10 strokes to a homogenous solution, an aliquot was removed for protein determination. Membranes were aliquoted and frozen at -80°C until use.

The radioligand binding assay is performed at room temperature in 96-well microtiter plates (No-binding Surface Plates, Corning 3600) with a final assay volume of 200µl/well  
25 in incubation buffer (50mM Tris buffer (pH 7.4 RT) containing 0.1 % BSA, 40 mg/L Bacitracin, complete EDTA-free protease inhibitor cocktail tablets 20 pills/L (Roche) and 3mM  $MnCl_2$ ). Competition binding curves were done by adding increasing amounts of the test compound. Test compounds were dissolved and serially diluted in DMSO, final DMSO concentration 1.5 % in the assay. 50µl Non labelled ZD 6021 (a non selective NK-  
30 antagonist, 10µM final conc) was added for measurement of *non-specific binding*. For *total*

*binding*, 50µl of 1.5% DMSO (final conc) in incubation buffer was used. [<sup>3</sup>H-Sar, Met(O<sub>2</sub>)-Substance P] (4nM final conc) was used in binding experiments on hNK<sub>1r</sub>. [<sup>3</sup>H-SR48968] (3nM final conc.) for hNK<sub>2r</sub> and [<sup>3</sup>H-SR142801] (3nM final conc) for binding experiments on hNK<sub>3r</sub>. 50µl radioligand, 3µl test compound diluted in DMSO and 47µl incubation  
5 buffer were mixed with 5-10µg cell membranes in 100µl incubation buffer and incubated for 30 min at room temperature on a microplate shaker.

The membranes were then collected by rapid filtration on Filtermat B (Wallac), presoaked in 0.1% BSA and 0.3% Polyethyleneimine (Sigma P-3143), using a Micro 96 Harvester (Skatron Instruments, Norway). Filters were washed by the harvester with ice-cold wash  
10 buffer (50mM Tris-HCl, pH 7.4 at 4°C, containing 3mM MnCl<sub>2</sub>) and dried at 50°C for 30-60 min. Meltilex scintillator sheets were melted on to filters using a Microsealer (Wallac, Finland) and the filters were counted in a β-Liquid Scintillation Counter (1450 Microbeta, Wallac, Finland).

The K<sub>i</sub> value for the unlabeled ligand was calculated using the Cheng-Prusoff equation  
15 (Biochem. Pharmacol. 22:3099-3108, 1973): where L is the concentration of the radioactive ligand used and K<sub>d</sub> is the affinity of the radioactive ligand for the receptor, determined by saturation binding.

Data was fitted to a four-parameter equation using Excel Fit.

$$K_i = IC_{50} / (1 + (L/K_d))$$

## Results

In general, the compounds of the invention, which were tested, demonstrated statistically significant antagonistic activity at the NK<sub>1</sub> receptor within the interval 7-9 for the pK<sub>B</sub>.

For the NK<sub>2</sub> receptor the interval for the pK<sub>B</sub> was 7-9. In general, the antagonistic activity  
25 at the NK<sub>3</sub> receptor was less than 7.5 for the pK<sub>B</sub>.

In general, the compounds of the invention, which were tested, demonstrated statistically significant CYP3A4 inhibition at a low level. The IC<sub>50</sub> values tested according to Bapiro et al; Drug Metab. Dispos. 29, 30-35 (2001) were generally greater than 2 µM.

Thus, the tested compounds according to the invention have been shown to be selective and dual NK<sub>1</sub>/NK<sub>2</sub> receptor antagonists as well as showing low levels of CYP3A4 inhibition.

### Biological evaluation

#### *Gerbil Foot Tap (NK1 specific test model)*

Male Mongolian gerbils (60-80g) are purchased from Charles River, Germany. On arrival, they are housed in groups of ten, with food and water *ad libitum* in temperature and humidity-controlled holding rooms. The animals are allowed at least 7 days to acclimatize to the housing conditions before experiments. Each animal is used only once and killed immediately after the experiment by heart punctation or a lethal overdose of pentobarbital sodium.

15 Gerbils are anaesthetized with isoflurane. Potential CNS-permeable NK1 receptor antagonists are administered intraperitoneally, intravenously or subcutaneously. The compounds are given at various time points (typically 30-120 minutes) prior to stimulation with agonist.

20 The gerbils are lightly anaesthetized using isofluorane and a small incision is made in the skin over bregma. 10 pmol of ASMSP, a selective NK1 receptor agonist, is administered icv in a volume of 5 µl using a Hamilton syringe with a needle 4 mm long. The wound is clamped shut and the animal is placed in a small plastic cage and allowed to wake up. The cage is placed on a piece of plastic tubing filled with water and connected to a computer  
25 via a pressure transducer. The number of hind feet taps is recorded.

*Fecal pellet output (NK2 specific test model)*

The in vivo effect (NK2) of the compounds of formula I can be determined by measuring NK2 receptor agonist-induced fecal pellet output using gerbil as described in e.g. The Journal of Pharmacology and Experimental Therapeutics (2001) 559-564.

Methods of preparation

In another aspect the present invention provides a process for preparing a compound of the formula (I) or salts thereof which process comprises:

- 10 a) reacting a compound of the formula (III) with a compound of the formula (IV):

15

wherein R1-R4, Het, and Ar are as hereinbefore defined; and the conditions are such that reductive alkylation of the compounds of the formula (III) forms an N-C bond between the nitrogen atom of the azetidine group of the compounds of formula (III) and the carbon atom of the aldehyde group of the compounds of formula (IV); or

20

- b) reacting a compound of the formula (III) with a compound of the formula (V):

23

wherein R1-R4, Het, and Ar are as hereinbefore defined; and L is a group such that alkylation of the compounds of the formula (III) forms an N-C bond between the nitrogen atom of the azetidine group of the compounds of formula (III) and the carbon atom of the compounds of formula (V) that is adjacent to the L group; or

c) reacting a compound of the formula (VI) with a compound of the formula (VII):

wherein R1-R4, Het and Ar are as hereinbefore defined; and L' is a leaving group; wherein any other functional group is protected, if necessary, and:

- i) removing any protecting groups;
- ii) optionally oxidizing any oxidizable atoms;
- iii) optionally forming a pharmaceutically acceptable salt.

Protecting groups may in general be chosen from any of the groups described in the literature or known to the skilled chemist as appropriate for the protection of the group in

question, and may be introduced and removed by conventional methods; see for example *Protecting Groups in Organic Chemistry*; Theodora W. Greene. Methods of removal are chosen so as to effect removal of the protecting group with minimum disturbance of groups elsewhere in the molecule.

5

It will also be appreciated that certain of the various optional substituents in the compounds of the formula (I) may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes described hereinabove. The reagents and reaction  
10 conditions for such procedures are well known in the chemical art.

The compounds of the formulae (III) and (IV) are reacted under conditions of reductive alkylation. The reaction is typically performed at a non-extreme temperature, for example 0 - 100 °C, in a substantially inert solvent for example dichloromethane. Typical reducing  
15 agents include borohydrides such as sodium cyanoborohydride.

The compounds of the formulae (III) and (V) are reacted under conditions of alkylation. Typically in the compounds of the formula (V) L is a leaving group such as halogen or alkylsulfonyloxy. The reaction is typically performed at an elevated temperature, for  
20 example 30 - 130 °C, in a substantially inert solvent for example DMF.

25

The compounds of the formula (III) are known or may be prepared in conventional manner. The compounds of the formula (IV) may be prepared, for example, by reacting a compound of the formula (VII) with a compound of the formula (VIII):

(VIII)

wherein R1-R4 are as hereinbefore defined under conventional acylation conditions.

The compounds of the formula (V) may be prepared, for example, by reacting a compound of the formula (VII) with a compound of the formula (IX):

(IX)

wherein R1-R4 and L are as hereinbefore defined under conventional acylation conditions.

- 10 The compounds of the formulae (VI) and (VII) may be reacted under conventional acylation conditions wherein

- 15 is an acid or an activated acid derivative. Such activated acid derivatives are well known in the literature. They may be formed in situ from the acid or they may be prepared, isolated and subsequently reacted. Typically L' is chloro thereby forming the acid chloride. Typically the acylation reaction is performed in the presence of a non-nucleophilic base, for example N,N-diisopropylethylamine, in a substantially inert solvent such as
- 20 dichloromethane at a non-extreme temperature.

The compounds of the formula (VIII) and (IX) are known or may be prepared in conventional manner.

- 25 Certain compounds of the formulae (III), (IV), (V), (VI), (VII), (VIII) and (IX) are novel and form part of the present invention.

Thus, another aspect of the invention is the intermediates

### Examples

It should be emphasised that the compounds of the present invention most often show  
highly complex NMR spectra due to the existence of conformational isomers. This is  
believed to be a result from slow rotation about the amide and/or aryl bond. The following  
abbreviations are used in the presentation of the NMR data of the compounds: s-singlet; d-  
doublet; t-triplet; qt-quartet; qn-quintet; m-multiplet; b-broad; cm-complex multiplet,  
which may include broad peaks.

The following examples will describe, but not limit, the invention.

The following abbreviations are used in the experimental: DCC (1,3-dicyclohexylcarbodiimide), DIPEA (*N,N*-diisopropylethylamine), DMF (*N,N*-dimethylformamide), TBTU (*N,N,N',N'*-tetramethyl-*O*-(benzotriazol-1-yl)uronium tetrafluoroborate), NMO (4-methylmorpholine *N*-oxide) and THF (tetrahydrofuran).

### Example 1

3,5-Dichloro-*N*-[(2*S*)-2-(3,4-dichlorophenyl)-4-(3-thiomorpholin-4-ylazetidin-1-yl)butyl]-*N*-methylbenzamide acetate

[(2*S*)-2-(3,4-Dichlorophenyl)-4-(3-thiomorpholin-4-ylazetidin-1-yl)butyl]methylamine hydrochloride (see Method 1; 89 mg, 0.21 mmol) was dissolved in DMF (2 mL) and to the resultant solution were added 3,5-dichlorobenzoic acid (44 mg, 0.23 mmol), TBTU (80 mg, 0.25 mmol) and DIPEA (108 mg, 0.84 mmol) in the given order. The solution was stirred at room temperature for 1.5 h, diluted with water and then neutralized by the addition of NaHCO<sub>3</sub>. The product was purified by reversed phase chromatography using a mixture of acetonitrile and 0.1 M ammonium acetate aq. There was obtained 43 mg (37%) of the title compound as a white solid. <sup>1</sup>H NMR (500 MHz, CD<sub>3</sub>CN): 1.3-1.8 (cm, 3H), 2.0-4.6 (cm, 23H), 6.8-7.7 (cm, 5H), 8.0 (d, 1H); LCMS: *m/z* 560 (M+1)<sup>+</sup>.

### Example 20

3-Cyano-*N*-[(2*S*)-2-(4-fluorophenyl)-4-(3-morpholin-4-ylazetidin-1-yl)butyl]-*N*-methyl-5,6,7,8-tetrahydronaphthalene-1-carboxamide

3-Cyano-*N*-[(2*S*)-2-(4-fluorophenyl)-4-oxobutyl]-*N*-methyl-5,6,7,8-tetrahydronaphthalene-1-carboxamide (see Method 19; 2.38 g, 6.3 mmol) and 4-azetidin-3-ylmorpholine dihydrochloride (see WO 00/63168; 1.49 g, 6.9 mmol) were mixed together with CH<sub>2</sub>Cl<sub>2</sub> (120 mL) and DIPEA (1.63 g, 12.6 mmol). The mixture was stirred until all the chemicals were dissolved. Sodium triacetoxyborohydride (1.87 g, 8.8 mmol) was added and the solution was stirred at room temperature overnight. The solvent was removed and the residue was partitioned between ethyl acetate and saturated NaHCO<sub>3</sub> (aq). The phases were separated and the aqueous solution was extracted with ethyl acetate. The combined organic

solutions were dried over  $\text{MgSO}_4$  and the solvent was removed by evaporation. The residue was diluted with a small amount of acetonitrile and the solution was kept in a freezer overnight. The crystals were collected by filtration and more material was then obtained from the mother liquor by an additional crystallisation from acetonitrile. There was obtained 1.43 g (45 %) in total of the title compound as an off-white solid.  $^1\text{H}$  NMR (500 MHz,  $\text{CD}_3\text{OD}$ ): 1.4-4.2 (cm, 31H), 7.0-7.6 (cm, 6H); LCMS:  $m/z$  505 ( $\text{M}+1$ )<sup>+</sup>.

The material was shown to be 99.6 % optically pure (enantiomeric excess) by analytical chiral HPLC (Chiralpak AD, 250 x 4.6 mm) using a mixture of heptane, isopropyl alcohol, triethylamine and formic acid (70/30/0.1/0.05) as mobile phase.

### Example 21

*N*-{(2*S*)-2-(4-fluorophenyl)-4-[3-(4-hydroxypiperidin-1-yl)azetidin-1-yl]butyl}-*N*-methyl-3,5-bis(trifluoromethyl)benzamide

*N*-[(2*S*)-2-(4-Fluorophenyl)-4-oxobutyl]-*N*-methyl-3,5-bis(trifluoromethyl)benzamide (see Method 20; 0.40 g, 0.91 mmol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (10 mL) and to the resultant solution were added 1-azetidin-3-ylpiperidin-4-ol diacetate (see Method 15 with the exception that the diacetate was used rather than the corresponding dihydrochlorid; 0.28 g, 1.0 mmol) and DIPEA (0.76 g, 5.8 mmol). The mixture was stirred for a few minutes at RT and then sodium triacetoxyborohydride (0.43 g, 2.0 mmol) was added. The solution was stirred at RT overnight and then the solvent was removed by evaporation. The residue was partitioned between ethyl acetate and saturated  $\text{NaHCO}_3$  (aq). The phases were separated and the aqueous solution was extracted twice with ethyl acetate. The combined organic solutions were washed with water, dried over  $\text{Na}_2\text{SO}_4$  and then the solvent was removed by evaporation. The residue was purified by flash chromatography using a mixture of

methanol and CH<sub>2</sub>Cl<sub>2</sub> as eluent. The product was dissolved in a mixture of water and acetonitrile and the solution was then freeze-dried. There was obtained 0.32 g (60 %) of the title compound as a white solid. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): 1.4-3.8 (cm, 24H), 6.8-7.5 (cm, 6H), 7.9 (s, 1H); LCMS: m/z 576 (M+1)<sup>+</sup>.
